

a

Seven claims require different evidence

1

Discrimination

Does any predictive signal exist?

2

Support specificity

Does this support outperform equal-pixel controls?

3

Anatomical location

Is this coordinate exceptional among translations?

4

Explanation faithfulness

Does a fixed model rely on that support?

5

Shortcut profile

Can non-target or coarse supports predict?

6

External evidence

Does the decision persist in another resource?

7

Clinical association

Does it generalize to people and outcomes?

CCA

A positive location margin is not a biomarker claim.

b

Two matched-control questions

② Support specificity

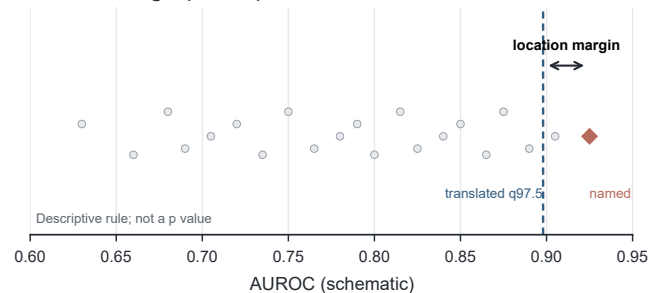

③ Anatomical location

Fresh fit per support; data, representation, estimator and split fixed.

c

Location margin (claim 3)

d

Non-equivalent evidence tiers

Resource	Unit	Access	Maximum inference
Simulation	repetition	public	mechanism decision
PD-DBS	image	restricted	image-level stress test
YouTubePD	clip	source-dependent	confounded clip audit
PARK	participant features	public	feature association
